核子醫學掃描 PET/CT	PET/CT全身腫瘤檢查 ▲ Whole body tumor screening ▲ 瞭解全身各部位是否有異常代謝率升高之腫瘤發生及發炎等情形。有些腫瘤代謝率並不會比正常組織明顯升高，如肝細胞癌，胰臟癌，泌尿道癌症，卵巢癌或息肉等，這一類的腫瘤偵測率因而較低。在正子造影中發現葡萄糖吸收增加的病灶時，必須參照臨床病史，考慮可能為是否有良性發炎現象；若非，則建議進一步檢查以確定病因。 To assess the whole body for tumors or inflammation associated with abnormally elevated metabolic rates. However, the metabolic activity of certain tumors—such as hepatocellular carcinoma, pancreatic cancer, urinary tract cancers, ovarian cancer, and polyps—may not be significantly higher than that of normal tissues; consequently, the detection rate for these types of lesions is lower. When lesions exhibiting increased glucose uptake are identified on PET imaging, they must be correlated with clinical history to consider the possibility of benign inflammation. If benign causes are unlikely, further examination is recommended to determine the definitive etiology.					★	★

循環腫瘤細胞 Circulating Tumor Cell	CTC檢測適用於上皮細胞癌種，非侵入性僅需抽血進行檢測，是直接偵測血液當中完整的「癌細胞」，提早偵測微小轉移風險，專一性高且風險明確，可定期連續監測 CTC detection is suitable for epithelial cell cancers. It is non-invasive and only requires blood testing. It directly detects complete "cancer cells" in the blood and detects the risk of micro-metastasis early. It is highly specific and the risk is clear, and can be continuously and regularly monitored.					★	★			★	★
